## GENERAL

### INTRODUCTION

#### SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

#### ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts: components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

### PERSONNEL SAFETY

The following precautions are recommended for personnel safety:

- DO NOT transmit if someone is within two feet (0.6 meter) of the antenna.
- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- All equipment should be properly grounded before power-up for safe operation.
- This equipment should be serviced by a qualified technician only.

#### FCC COMPLIANCE AND TYPE ACCEPTANCE NUMBERS

Type acceptance number	Frequency range	Compliance
ALHTK-705-1	150 ~ 174MHz	Parts 15, 22, 74 and 90

### 1. POWER-UP

To turn on the radio, press the power switch (IO). The channel indicator will illuminate to indicate power is ON.

### 2. TO RECEIVE

Operation	Procedure
1. Disable QT (if so equipped)	Remove microphone from its hanger.
2. Unsquench radio	Press the SQUELCH switch (↘).
3. Set VOLUME control	Adjust VOLUME control for a normal listening level.
4. Set SQUELCH control	Press the SQUELCH switch (↘) again.
5. Select operating frequency. (Multichannel models only)	Rotate CH selector switch to desired channel.
The radio will now receive all traffic on the selected channel.	
6. Enable QT (if so equipped)	Insert microphone back into its hanger to activate KQT-8.
You will now hear messages for your system only.	

### 3. TO TRANSMIT

Operation	Procedure
1. Disable QT (if so equipped)	Press the MONITOR switch (↖) or remove microphone from hanger.
2. Select operating frequency. (Multichannel models only)	
3. LISTEN	DO NOT TRANSMIT if channel is in use.
4. Key transmitter	Press and hold the microphone PTT switch. The LCD on the front panel will indicate the transmitter is ON (↗).
5. Transmit message	Hold microphone at about 2 inches distance and speak at a normal voice level. Keep transmissions brief.
6. Receive reply	Release the microphone PTT switch.
7. Enable QT at end of the conversation. (if QT equipped)	Press the MONITOR switch (↖) and replace the microphone into its hanger.

## SYSTEM SET-UP

### System Set-up

# INSTALLATION

## Installation of KQT-8

1. Remove the top case of the radio.
2. Remove the speaker ( ❶ ) and cable with connector ( ❷ ) from the radio.
3. Lift off the speaker holder from the radio ( ❸ ).
4. Remove the tube ( ❹ ) from the cable with connector ( ❸ ) in the radio, then remove the resistor R301 : RD14BB2B2R2 ( ❺ ).

5. Attach the cushion supplied with the KQT-8 to the foil side of the KQT-8 ( ❷ ).
6. Remove the paper from the cushion attached to the KQT-8, and stick the cushion onto the top case of the PLL unit ( ❸ ).
7. Connect the cable with connector ( ❹ ) to the connector of the KQT-8.
8. Insert the cable with connector ( ❷ ) of the speaker into the radio.
9. Reinstall the speaker holder ( ❸ ) in its original position in the radio, and place the speaker in the holder.

## CONVERSION

### Time-out-timer Conversion (TOT)

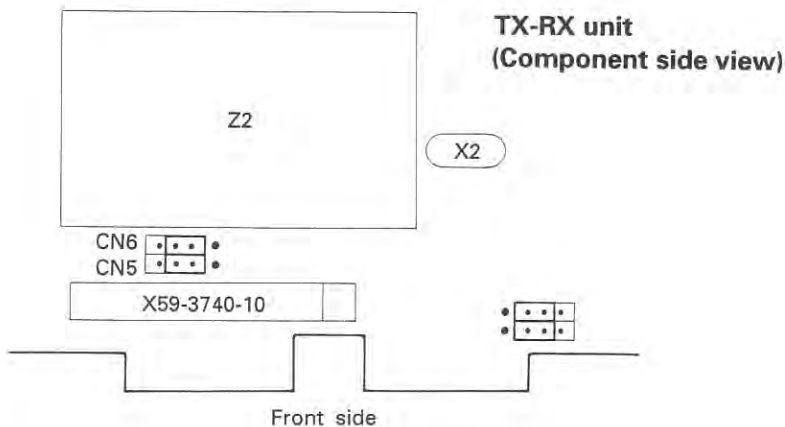

The time-out-timer returns the unit to the receive state automatically when transmission continues beyond a certain length of time.

The time limit for the time-out-timer is set by changing the short socket (E18-0254-05) of the connectors (CN5 and CN6) on the TX-RX unit (A/2).

Remove the socket from above.

TOT (sec)	CN5	CN6
$\infty^*$	Side marked	Side marked
30	Side marked	Opposite side
60	Opposite side	Side marked
60	Opposite side	Opposite side

\* : BASIC

### Busy Channel Lockout Conversion

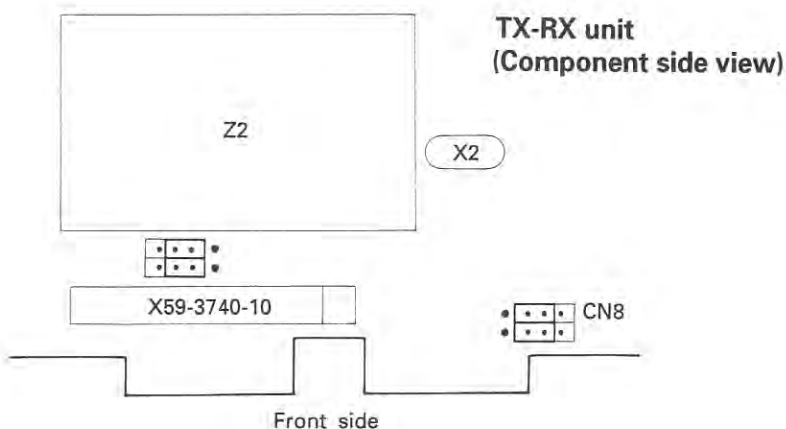

Busy channel lockout inhibits transmission from the local unit when some signaling has been set for the local unit and BUSY is ON and signaling mismatches.

The busy channel lockout is set by changing the short socket of the connector (CN8) on the TX-RX unit (A/2).

Remove the socket from above.

CN8	
Opposite side	Side marked*
Function operative	Function inoperative

\* : BASIC

## CONVERSION / FREQUENCY WRITING METHOD

### PLL Channel Step Conversion

The PLL channel step frequency is changed from 5kHz to 6.25kHz.

The frequency is set by changing the chip jumpers R207, R208 : R92-0670-05 on the TX-RX unit (B/2)

	R207	R208
5kHz*	○	○
6.25kHz	X	○

\* : BASIC

○ : Installed

X : Removed

TX-RX unit (B/2) (Foil side view)

### Frequency Writing Method (Function Select)

Function select I and II have the following mode 1) to 5). When frequencies and signaling data are written for the first time after delivery, use the frequency setting mode. Select an appropriate mode as required.

#### 1. Function I and II setting method

To change the function to I or II, change the short socket of the connector CN7 on the TX-RX unit (A/2).

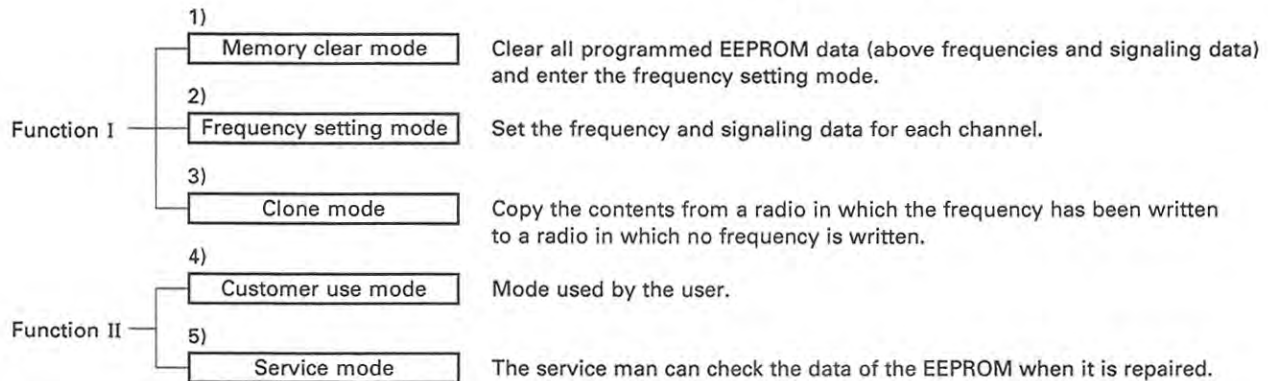

Remove the socket from above.

## FREQUENCY WRITING METHOD

### 2. Modes

**Note : After checking or setting in each mode, deliver the product with the customer use mode of Function II set.**

#### 1) Memory clear mode

This mode is set by turning the POWER switch on while pressing the MONITOR switch (  ).

After all data of the built-in EEPROM (transmit/receive frequency and transmit/receive signaling data) has been cleared, the frequency setting mode is set.

#### 2) Frequency setting mode

##### • Notes

Frequency setting is normal changed in 5kHz (6.25kHz) steps. If the channel selector is turned while pressing the SQUELCH switch (  ), it is changed in 1MHz steps.

If the signaling unit is not installed, the transmit/receive signaling data setting is not displayed by the CHANNEL indicator.

Transmission or reception cannot be performed in this mode.

##### • Writing method (See flowchart)

When the power switch is turned on, the receive frequency setting mode of CH1 on the channel indicator is set. (Only CH1 is initialized to 150.000MHz.)

The transmit/receive frequency and transmit/receive signaling data are set for each channel using the following procedure :

1. Set the receive frequency with the channel selector.
2. Press the PTT switch. The receive frequency specified in step 1 is memorized and the channel indicator shows receive signaling data input mode. The initial indication is off.

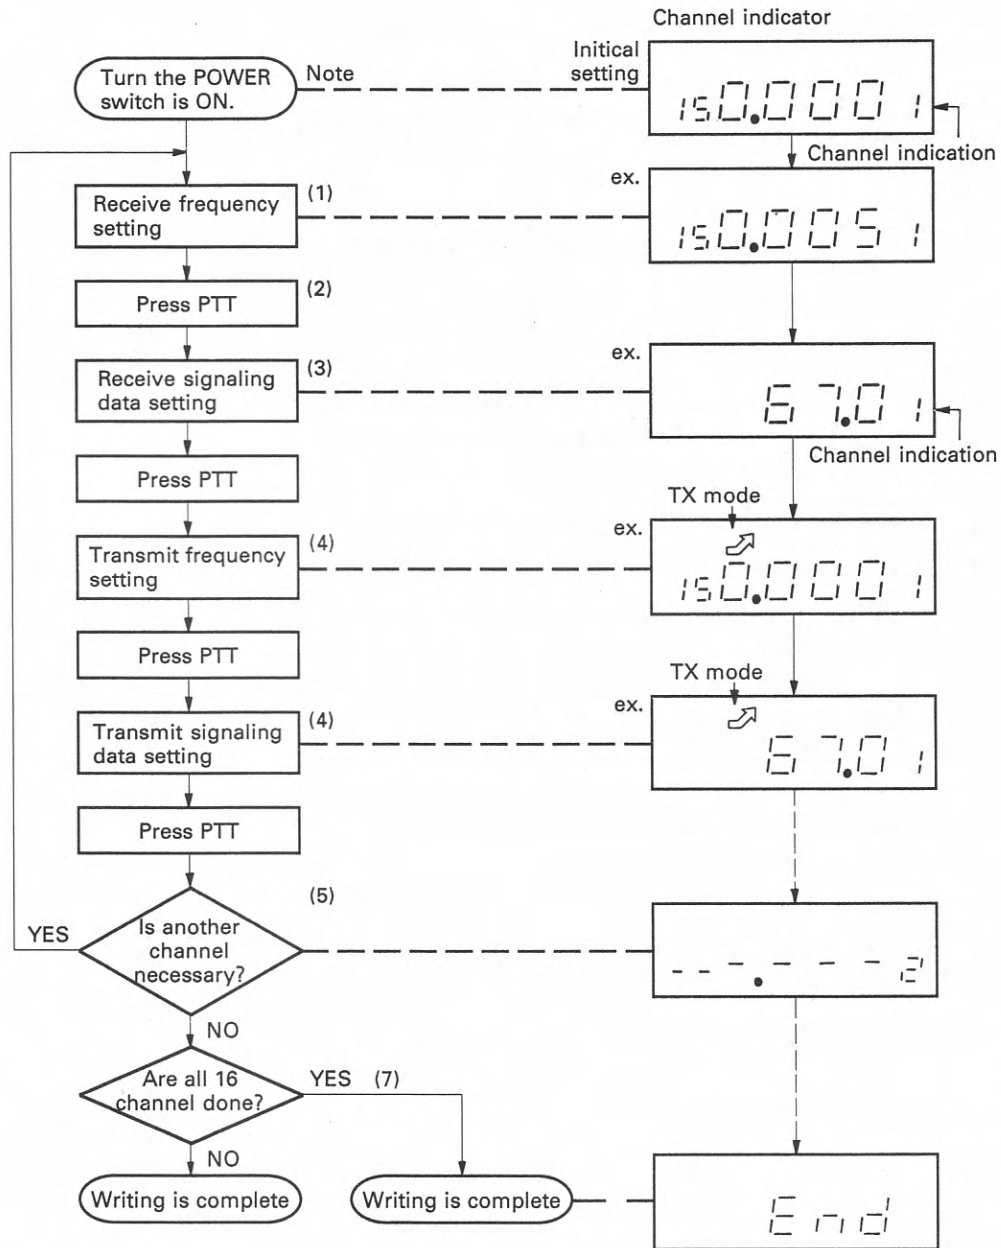

3. Set the receive signaling data with the channel selector and press the PTT switch. If the receive signaling data is not set, press the PTT switch.
4. The channel indicator now shows transmit frequency input mode. Set the transmit frequency by following step 1 to 3.

5. Repeat steps 1 to 4 for the channels for which frequencies need to be set.
6. If frequencies for a channel need not be set, simply press the PTT switch. The next step will be displayed.
7. When all 16 channels have been set up, "E.T.C" is displayed.
8. When setting is finished, the written contents can be checked by pressing the MONITOR switch (  ). Even when channel data is being checked with the MONITOR switch, the CHANNEL selector, PTT, and SQUELCH switch are valid, and channel data can be rewritten.

# FREQUENCY WRITING METHOD

• Flowchart of frequency setting mode

## FREQUENCY WRITING METHOD

### 3) Clone mode

In this mode, two RADIOS are connected, and the contents of the EEPROM data written in one are copied to the EEPROM of the other.

**Note :** When using the clone mode, verify that the **Function Select (page 7) is set to Function I (the CN7 shorting socket is set to "Side marked")**.

**The first IF and PLL step frequency must be set by the same model.**

#### • Operation method

1. Pull out the CHANNEL selector knobs of the two radios.
2. Connect the two radios to the DC power supply. Connect the two radios with the supplied microphone cable (microphone connectors).
3. With the memory clear mode, clear the contents of the EEPROM of the radio to which the frequencies are to be written.
4. Set the two radios to the clone mode by turning on the POWER switch while pressing the "SET 1" key behind the CHANNEL selector with a thin insulating rod. The CHANNEL indicator will show "- [ ] -".
5. Press again the "SET 1" key of the radio in which the frequencies have been written. The TX indicator will be displayed, and writing of frequencies will begin.

Radio from which data is written

Radio to which data is written

6. Data transfer ends in about 15 seconds, a beep sounds, and the CHANNEL indicator shows "End" (on both radios).

7. Switch to the customer use mode of Function II, and finish writing.

### 4) Customer use mode

The user can use the radio in this mode.

Set Function II, then turn the POWER switch on to set this mode. (This mode is not set if the POWER switch is turned on while the "SET 1" key is held down.)

### 5) Service mode

The service man can check the data of the EEPROM in this mode during repair.

Set Function II, then turn the POWER switch on while the "SET 1" key is held down to set the service mode. The receive frequency of CH1 is displayed.

The data for each channel can be checked by pressing the MONITOR switch. However, the CHANNEL selector, PTT, and SQ OFF keys do not work.

## DISASSEMBLY FOR REPAIR

### Removing the Front Panel

1. Remove the four screws holding the upper and lower cases (1).

2. Pull out the CHANNEL selector knob (2) and volume control knob (3).
3. Slightly lift the stoppers holding the top and bottom of the front panel and pull out the front panel (4).
4. Remove the cushions (5, 6).

5. Remove the four screws on the sub-panel (7).
6. Pull the display section forward (8).
7. Remove the hexagonal nuts of the CHANNEL selector and volume controls (9).
8. Pull the sub-panel forward (10).
9. Remove the two screws holding the TX-RX unit (B/2), and remove the unit (11).

## LEVEL DIAGRAM

### Receiver section

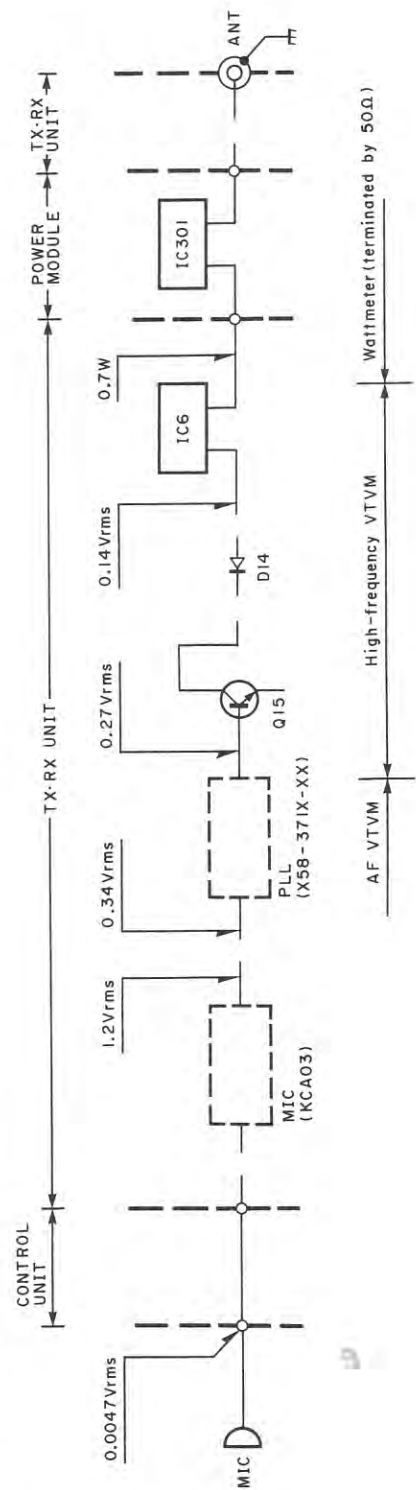

SG input level for which a 12dB SINAD are obtained. Measured by connecting the SG to each point via a 0.01μF capacitor.

AF VTVM

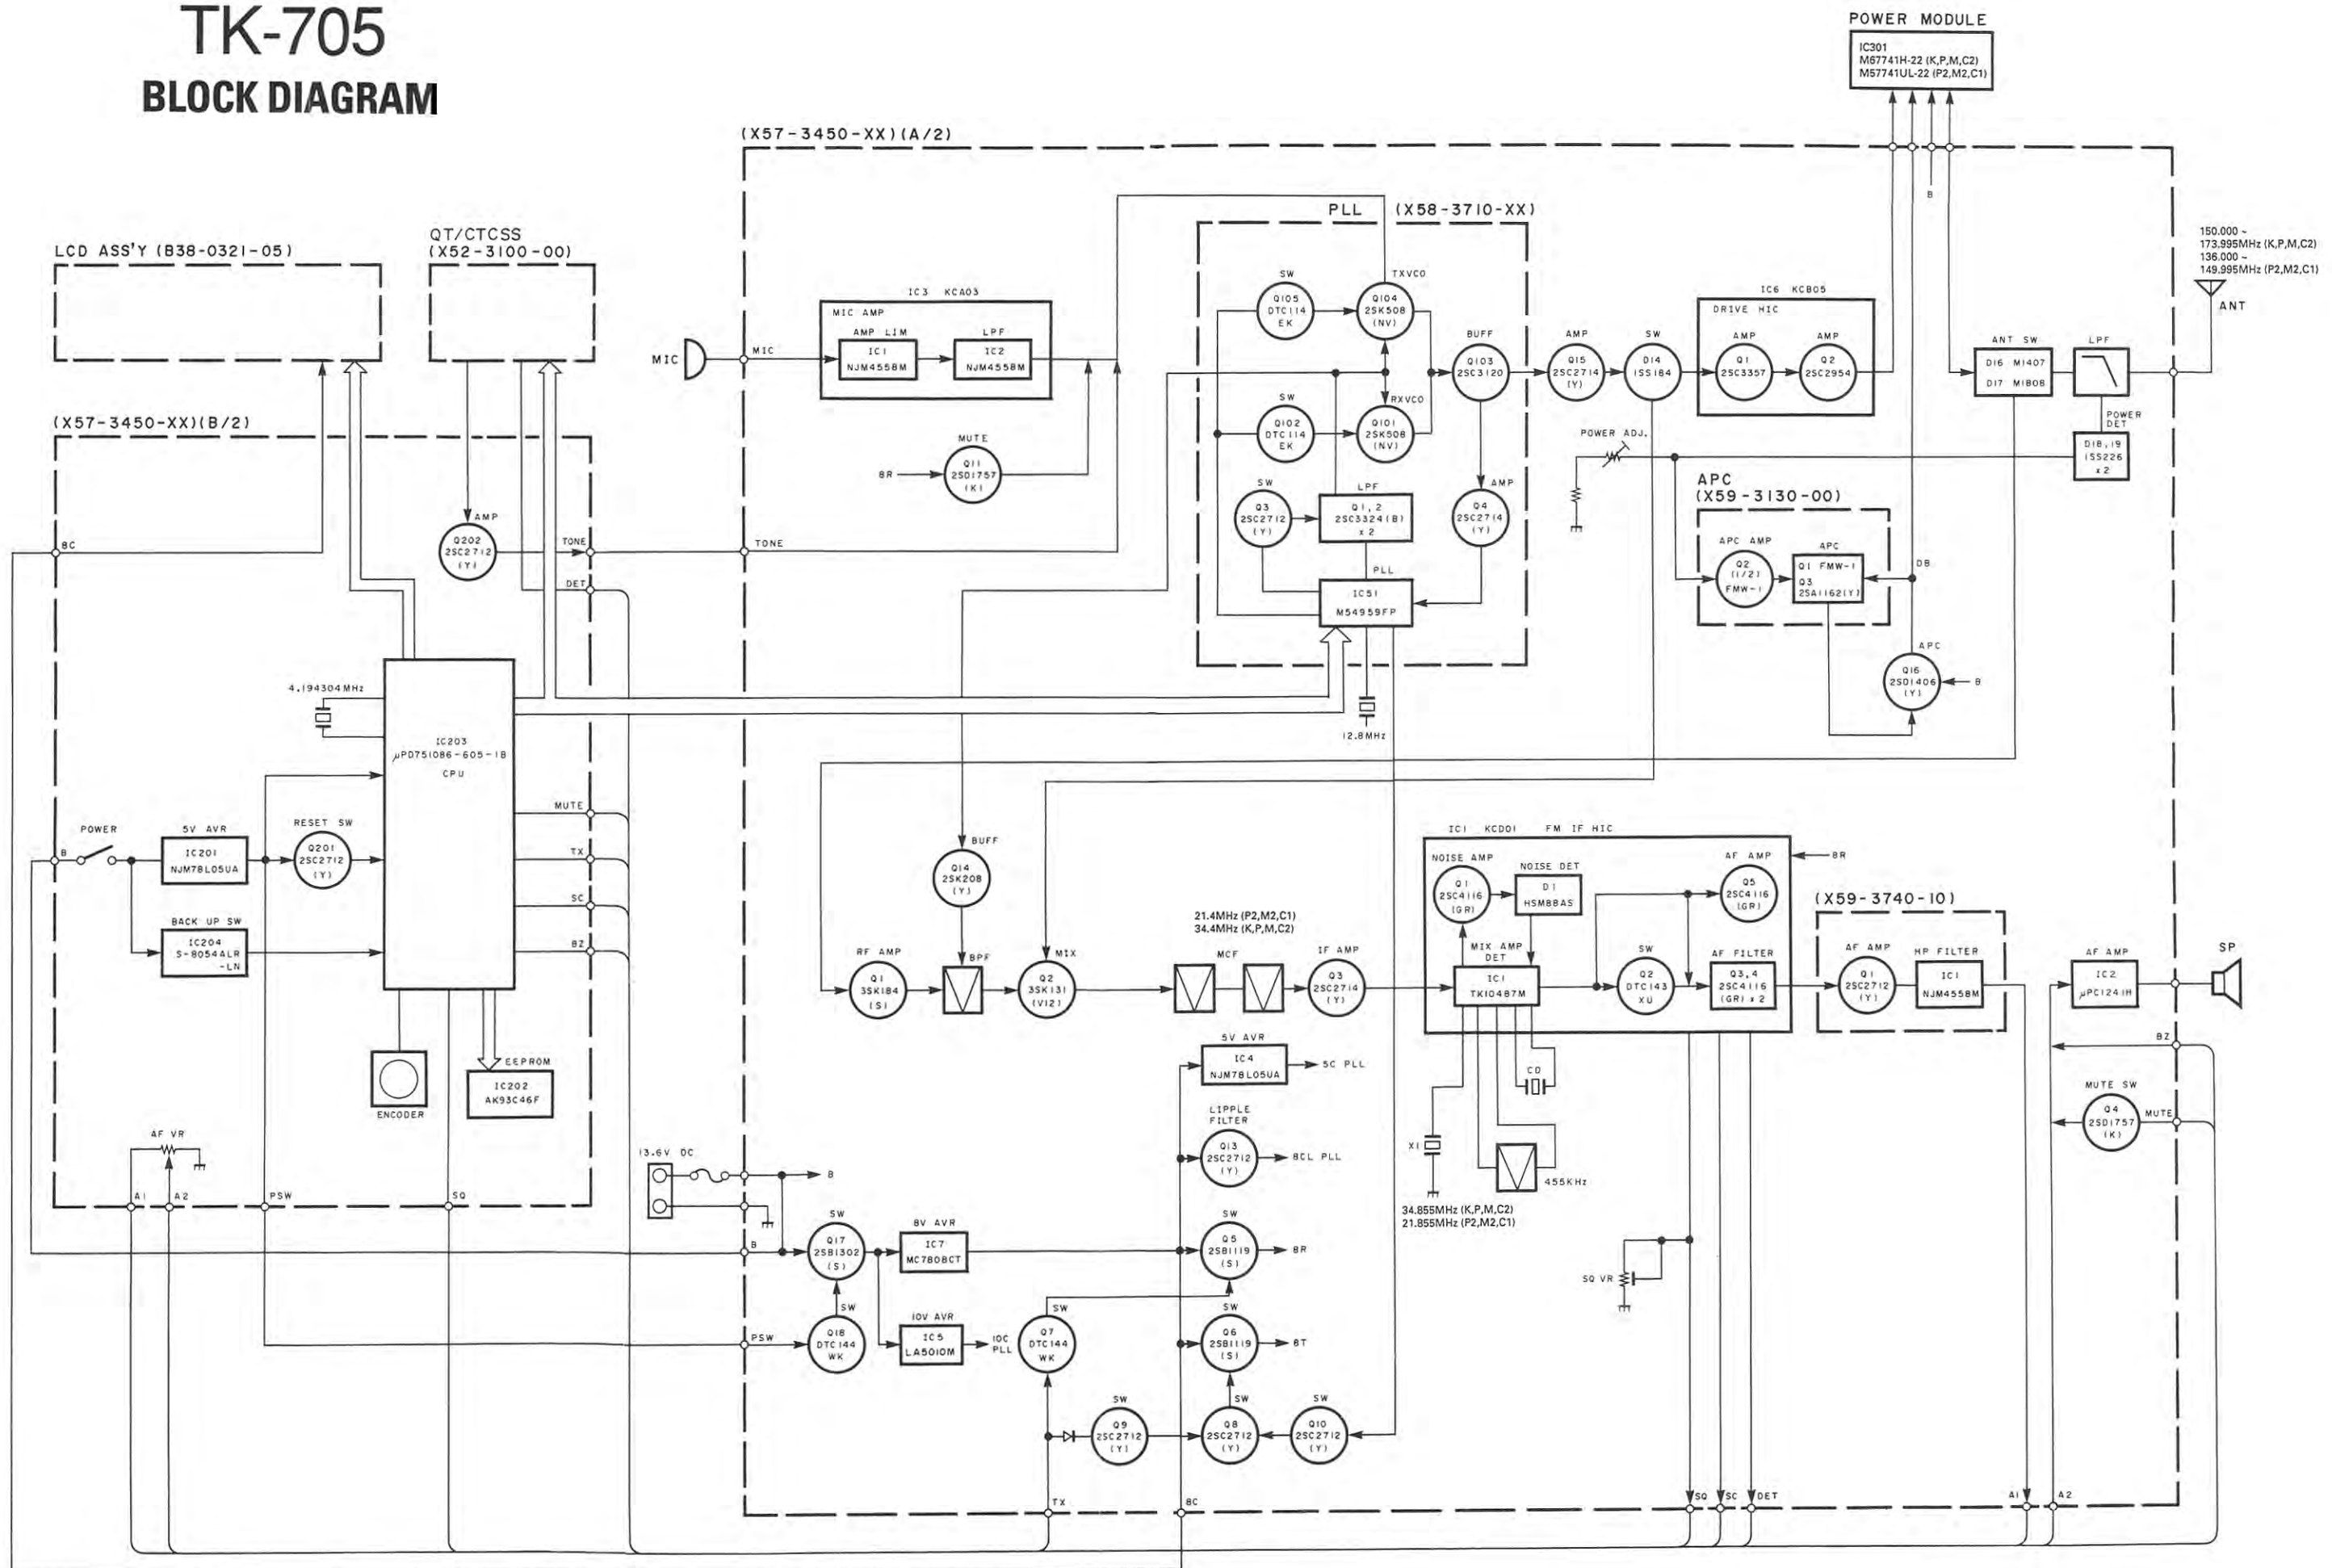

AF level obtained when the AF output level is adjusted for 0.45V/4Ω with the front panel AF VOL control. Measured with AF voltmeter connected to the external speaker jack, receiving a 40dB EMF SSG signal modulated at 1kHz, DEV 3kHz.

### Transmitter section

1. AG is set so that MIC input becomes 3kHz DEV at 1kHz MOD.
2. Transmitting frequency : 145.06MHz

Table 1

### Circuit Configuration By Frequency

The TK-705 incorporates a PLL synthesizer which uses a digital VFO to allow any channel step of 5 or 6.25kHz to be selected (See Figure 1).

The receiving system utilizes double-conversion techniques. That is, an incoming signal is mixed down to the 1st intermediate frequency (IF) of 34.4MHz (K,P,M,C2), 21.4MHz (P2,M2,C1), using a 1st local oscillator frequency of from 115.600 to 139.595MHz (K,P,M,C2), 114.600 to 128.595MHz (P2,M2,C1). The 1st IF signal is then mixed with the 2nd local oscillator frequency of 34.855MHz (K,P,M,C2), 21.855MHz (P2,M2,C1) to generate the 2nd IF of 455 kHz.

The transmitting system consists of a PLL circuit which allows direct modulation and direct frequency division. Signals from the PLL circuit are amplified by a linear amplifier for transmission.

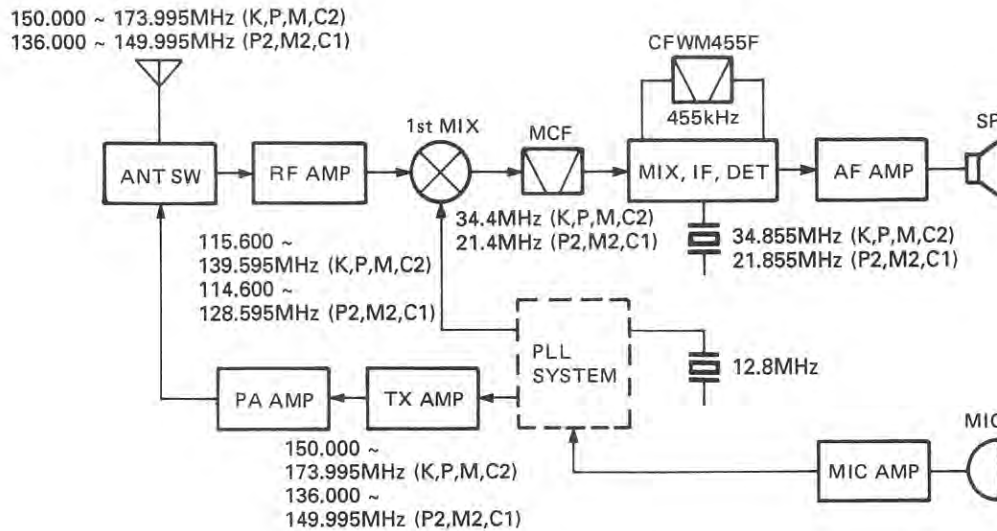

Fig. 1 Frequency configuration

## CIRCUIT DESCRIPTION

### Receiving System

#### • Overview

Incoming signals from the antenna pass through a low-pass filter in the final block of the transmitter system, and are switched to the front-end of the receiver system via a receive/transmit switching diode.

The signals are then passed through an antenna matching coil, where the high-frequency components are amplified by a GaAs FET. The signals are then fed into a four-stage bandpass filter that uses varactor diode tuning to reject unwanted signal components, and is fed to the 1st mixer. The 1st mixer uses the N-channel MOS FET that are used in the RF stage to obtain better two-signal characteristics. The 1st mixer mixes the signal with the 1st local oscillator frequency and converts it to the 1st IF (34.4/21.4MHz). The signal then passes through two monolithic crystal filters (MCFs) to remove unnecessary near-by frequency components. The signal from the MCFs is used as the 1st IF signal.

The 1st IF signal is amplified and fed into IC1 (KCD01) in the FM IF HIC. The IF signal is then mixed with the 2nd local oscillator frequency of 34.855/21.855MHz to generate the 2nd IF of 455kHz. The 455kHz signal is then passed through a six element ceramic filter (CFWM455F), and fed back into IC1 for additional amplification. The output signal from the IC1 is then fed into a power amplifier via the audio volume control for application to the speaker.

Item	Rating
Nominal center frequency	34.4MHz
Pass band width	±7.5kHz or more at 3dB
Attenuation band width	±28kHz or less at 40dB
Ripple	1.5dB or less
Insertion loss	3dB or less
Guaranteed attenuation	60dB or more within ±1MHz (Spurious : 40dB or more)
Terminating impedance	800Ω/1.5pF

## CIRCUIT DESCRIPTION

### Transmitting System

#### • Overview

The transmitter produces the target frequency thru the use of direct FM-modulation via a varactor diode.

#### • Modulation circuit

Audio signals from the microphone are fed into the mic amplifier HIC IC3 (KCA03) for amplification into two operational amplifiers. The operational amplifiers form a splatter filter for pre-emphasis, amplification, limiting, and removal of unnecessary high-frequency components.

The FM modulation circuit directly FM-modulates the VCO signals, using a varactor diode.

#### • Pre-amplifier stage circuit

Signals from the VCO are applied to the drive HIC IC6 (KCB05). The amplifier always operates in a linear mode so that signals can be amplified without degradation. Additionally, the amplifier is designed to cover a wide range of frequencies and can produce stable output without adjustment. The APC (Automatic Power Control) controls collector voltage from the last stage of the pre-amplifier.

#### • Power amplifier circuit

The drive signal is amplified to the required level by the power module. The TK-705 uses a large heat sink for efficient heat dissipation.

#### • APC circuit

The APC circuit for automatic transmit output control detects part of the power module output, and amplifies it to provide a control voltage for output control. The output control voltage is in inverse proportion to the output from the power module, so it is maintained at the same level.

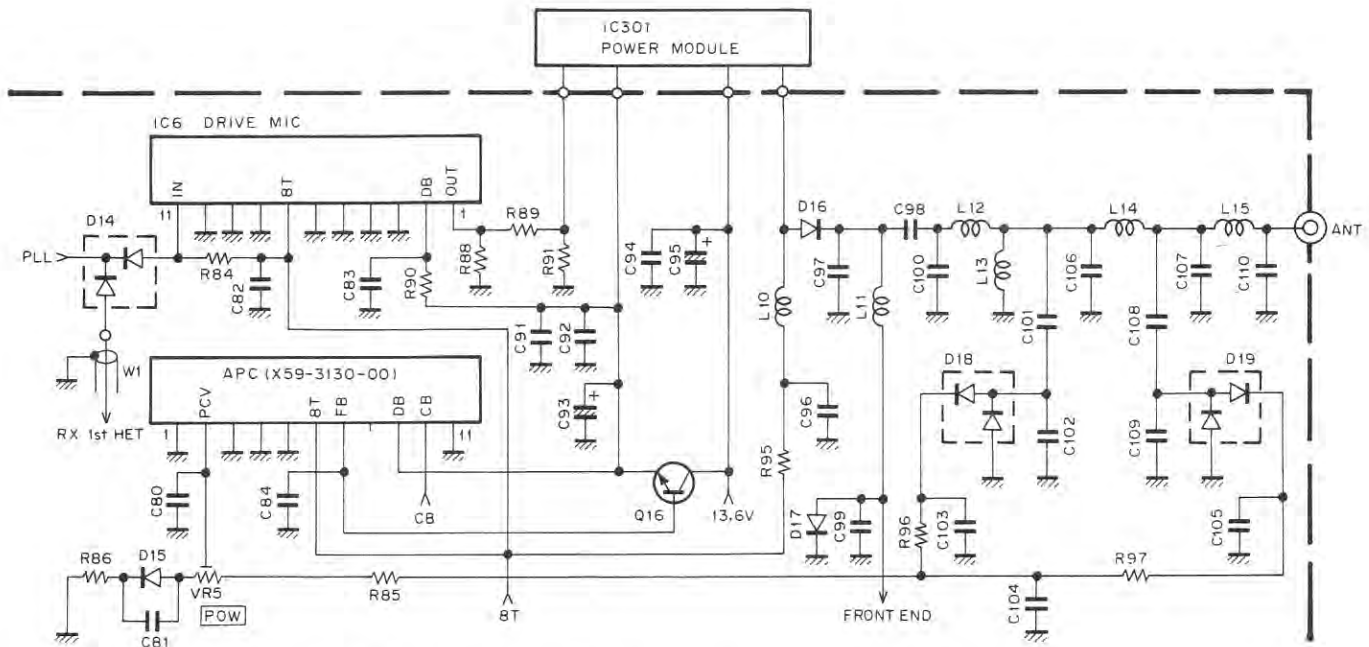

Fig. 3 Pre-amplifier stage, power amplifier, and APC circuits

Item	Symbol	Condition	Rating	Unit
Operating voltage	Vcc		17	V
Current consumption	Icc		7	A
Input power	Pin	Vcc1≤12.5V, ZG=ZL=50Ω	500	mW

## CIRCUIT DESCRIPTION

### PLL Synthesizer System

#### • Overview

Figure 4 is the PLL and VCO block diagram. In the TK-705, the PLL system is implemented as a sub-unit which is divided into the upper VCO and lower PLL blocks. The sub-unit is shielded to prevent external interference.

There are two reference frequencies, 6.25kHz and 5kHz, available to allow 5 and 6.25kHz-step operation. The 6.25kHz is obtained by dividing the reference oscillator frequency of 12.8MHz by 2048, and the 5kHz is obtained by dividing it by 2560. The VCO directly generates the dial frequency. This dial frequency is amplified once and then fed into a pulse swallow-type PLL IC for frequency division and phase comparison, in order to lock the frequency.

The PLL system is locked between transmit mode and receive mode. By using a signal ("H" in transmit mode) from pin 11 of the PLL IC (M54959FP), the LPF is deactivated-activated by Q3 only for the moment when the TK-705 enters transmit mode. This helps produce lock more rapidly than previous methods.

In 150MHz mode,  $f_{VCO}$  (RX) is calculated by the following formula:

$$f_{VCO} = (150 - 34.4) = \{(n \times 128) + A\} \times f_{OSC} / R$$

where,

$f_{VCO}$  : VCO output frequency

$n$  : Binary value of the 10-bit programmable counter

$A$  : Binary value of the 7-bit programmable counter

$f_{OSC}$  : 12.8MHz reference frequency

$R$  : Binary value of the 14-bit programmable counter

2560 (5kHz step mode)

2048 (6.25kHz step mode)

In 5kHz step mode,

$n = 180$  and  $A = 80$ .

Therefore,  $f_{VCO}$  is calculated as follows:

$$f_{VCO} = \{(180 \times 128) + 80\} \times 12800 / 2560$$

$$= \{23040 + 80\} \times 5$$

$$= 115600 = 115.600\text{MHz}$$

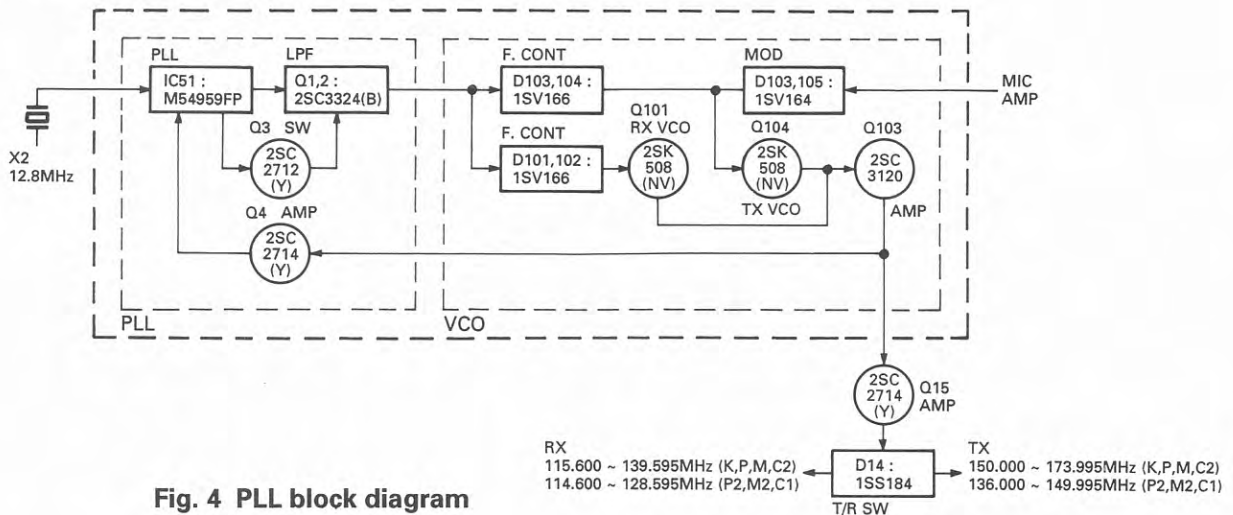

Fig. 4 PLL block diagram

#### • 8T (8V in transmit mode) and unlock circuits

In receive mode, the base of Q9 has 0.7V. As a result, Q9 is on, and Q8 and Q6 are off, and the collector of Q6 (8T) provides no voltage.

When the PTT switch is depressed. As a result, P121 of CPU becomes "L", turning Q9 off, and Q8 and Q6 on. The 8T line is therefore supplied with 8V.

The unlock circuit operates only in transmit mode. Q10 is a PLL unlocking switching transistor. Usually, the base of Q10 is supplied with 0V ("L"), and the collector is supplied with 8V ("H").

When the PLL is unlocked, the base of Q10 is supplied with 0.7V, turning Q10 on. As a result, the collector of Q10 becomes "L" (0V). This turns Q8 off and the base of Q6 becomes 8V, turning it off. Therefore, when the PLL is unlocked, Q6 is off removing bias voltage from the 8T line. Without the 8T voltage no transmit signal is generated.

Fig. 5 8T and unlock circuits

## CIRCUIT DESCRIPTION

### Digital Control System

#### • Overview

The control system consists of a 4 bit micro-controller (IC203), a reset circuit (Q201), a memory back-up circuit (IC204) and an Electronically Erasable Read Only Memory (EEPROM).

#### • Frequency programming of transmit and receive

Transmit and receive frequencies are programmed by using the channel selector and the PTT switch on the transceiver when an internal jumper is installed.

After the internal jumper is removed, the transceiver reverts to the user mode and the channel selector only selects those frequencies already programmed into the EEPROM.

#### • Reset and back-up circuits

Micro-controller reset and memory back-up are enabled by monitoring 5C voltage.

At initial power on, a differentiator (C203) turns on Q201 to initiate reset of the micro-controller (IC203). If the voltage rises slowly, the output voltage transient of IC204 is detected by IC203 and reset is initiated internally.

If 5C voltage falls below 4.5V, the output of IC204 becomes low, causing the micro-controller to go to the back-up mode.

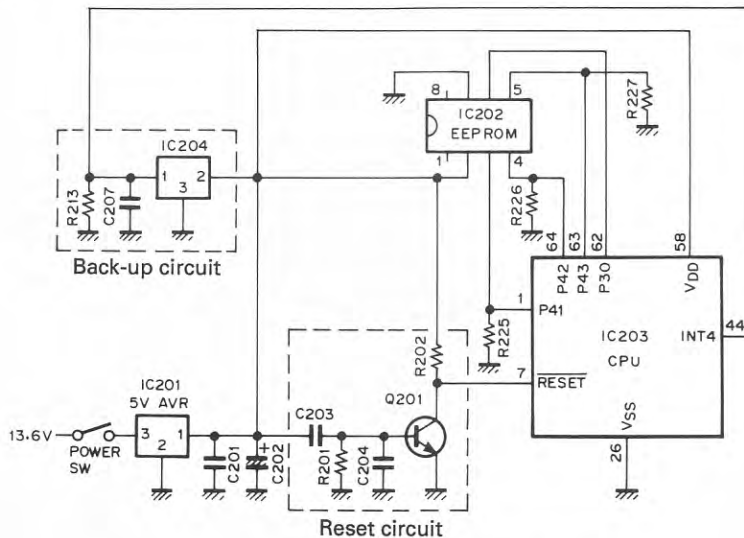

Fig. 6 Reset and back-up circuits

#### • Display circuit

The display circuit is contained in the LCD assembly. It consists of a LCD driver, its peripheral circuits, and an LCD. The LCD is dynamically operated at a 50% duty cycle. The LCD driver receives LCD data from P21, P22, and P23 of the CPU.

#### • PLL data output

PLL data is available from P72 (CK), P73 (DT), and P71 (EN1) of the CPU. Figure 7 is a timing chart for PLL data transfer, and Figure 8 shows the format of PLL data.

Fig. 7 Timing chart for PLL data transfer

The 21-bit data is made up of the following:

#### 1. Division ratio data A and N (17 bits)

$F$  (display – 34.4MHz in RX mode)

$$= \{(N \times 128) + A\} \times 12.8\text{MHz} / \text{ref}$$

$N$  : Division ratio set in 10-bit main counter (binary)

$A$  : Division ratio set in 7-bit swallow counter (binary)

#### 2. Reference frequency (ref) select (2 bits)

Data		Phase reference frequency	
D1	D2		
L	L	5kHz	5kHz step mode
H	L	6.25kHz	6.25kHz step mode

#### 3. Switch select (2 bits)

Data		Output port		
D3	D4	SW1	SW2	
L	H	L	H	RX mode
H	L	H	L	TX mode

Fig. 8 PLL data format

## CIRCUIT DESCRIPTION

## • Input and output of QT/CTCSS unit (option)

The optional CTCSS unit receives data from P70, P72, and P73 of the CPU. Figure 9 is a timing chart for CTCSS data transfer, and Figure 10 shows the format of CTCSS data. When a tone from the CTCSS unit is detected, a "H" level signal is sent to P61 of the CPU, opening the squelch.

Fig. 9 Timing chart for QT/CTCSS data transfer

Component	Use/Function	Operation/Condition/Compatibility
IC1	2nd local oscillator, IF amplification, detection, low-frequency amplification, noise amplification, noise detection, squelch switching	① 1st IF signal input. ③ ④ 2nd local oscillator. ⑨ Busy output. ⑩ Squelch control. ⑪ S-meter output. ⑬ RD output. ⑮ Low-frequency output.
IC2	AF amplification	① AF input, ⑧ AF output.
IC3	Mic amplification	① Mic input, ② Mic output.
IC4	5V AVR	
IC5	10V AVR	For PLL.
IC6	Transmit drive	
IC7	8V AVR	
IC201	5V AVR	
IC202	EEPROM	
IC203	Microprocessor	See circuit description.
IC204	Voltage detector	
Q1	High-frequency amplification	Operates in receive mode.
Q2	1st mixer	Converts received 144MHz-range signals to 1st IF 10.7MHz.
Q3	High-frequency amplification	Amplifies 1st IF signal.
Q4	AF line mute	Operates when transmit mode, AL 1ch receive mode, CTCSS, bell or squelch is ON.
Q5	8R switching	ON in receive mode.
Q6	8T switching	ON in transmit mode.
Q7	8R switching control	ON in receive mode.
Q8	8T switching control	ON in transmit mode.
Q9	8T switching control	OFF in transmit mode.
Q10	8T switching control	OFF when PLL locked.
Q11	Mic line mute	ON in receive mode.
Q13	PLL 8V ripple filter	
Q14	CV line buffer	
Q15	VCO output amplification	
Q16	TX drive stage +B control	
Q17	Power switch	
Q18	Power switch control	ON when power switch is ON.
Q201	Reset switch	ON for approx. 3m s when system power turned on, usually OFF.
Q202	Tone amplification	
D4	VCO output switch	
D5	Temperature compensation	
D9	Vari-cap tuning	
D11	12.8MHz tuning	For PLL.
D10~12	Reverse current prevention	
D16, 17	Transmit/receive switching	
D18, 19	Power detection	For APC.
D20	Reverse power protection	
D201	CPU protection	

## PARTS LIST

### CAPACITORS

CC 45 TH 1H 220 J  
 1 2 3 4 5 6

- 1 = Type ..... ceramic, electrolytic, etc.
- 2 = Shape ..... round, square, etc.
- 3 = Temp. coefficient
- 4 = Voltage rating
- 5 = Value
- 6 = Tolerance

#### • Temperature Coefficient

1st Word	C	L	P	R	S	T	U
Color*	Black	Red	Orange	Yellow	Green	Blue	Violet
ppm/°C	0	-80	-150	-220	-330	-470	-750

#### • Capacitor value

- 0 1 0 = 1pF
- 1 0 0 = 10pF
- 1 0 1 = 100pF
- 1 0 2 = 1000pF = 0.001μF

1 0 3 = 0.01μF

2 2 0 = 22pF  
 ↑ ↑ ↑  
 1st number | Multiplier  
 2nd number

2nd Word	G	H	J	K	L
ppm/°C	± 30	± 60	± 120	± 250	± 500

Example CC45TH = -470 ± 60 ppm/°C

#### • Tolerance

Code	C	D	G	J	K	M	X	Z	P	No code
(%)	± 0.25	± 0.5	± 2	± 5	± 10	± 20	+ 40 - 20	+ 80 - 20	+ 100 - 0	More than Less than 10μF-10~+50 4.7μF-10~+75

Code	B	C	D	F	G
(pF)	± 0.1	± 0.25	± 0.5	± 1	± 2

Less than 10 pF

#### • Rating voltage

2nd word \ 1st word	A	B	C	D	E	F	G	H	J	K	V
0	1.0	1.25	1.6	2.0	2.5	3.15	4.0	5.0	6.3	8.0	-
1	10	12.5	16	20	25	31.5	40	50	63	80	35
2	100	125	160	200	250	315	400	500	630	800	-
3	1000	1250	1600	2000	2500	3150	4000	5000	6300	8000	-

#### • Chip capacitors

#### Dimension

Dimension code	L	W	T
Empty	5.6 ± 0.5	5.0 ± 0.5	Less than 2.0
E	3.2 ± 0.2	1.6 ± 0.2	Less than 1.25
F	2.0 ± 0.3	1.25 ± 0.2	Less than 1.25

#### Dimension

Dimension code	L	W	T	Wattage
E	3.2 ± 0.2	1.6 ± 0.2	0.57	2B
F	2.0 ± 0.3	1.25 ± 0.2	0.45	2A

#### Rating wattage

Code	Wattage	Code	Wattage	Code	Wattage
2A	1/10W	2E	1/4W	3A	1W
2B	1/8W	2H	1/2W	3D	2W
2C	1/6W				

### RESISTORS

#### • Chip resistor (Carbon)

#### • Carbon resistor (Normal type)

- 1 = Type ..... ceramic, electrolytic, etc.
- 2 = Shape ..... round, square, etc.
- 3 = Dimension
- 4 = Temp. coefficient
- 5 = Voltage rating
- 6 = Value
- 7 = Tolerance.

## ADJUSTMENT

### Test Equipment Required for Alignment

No.	Test Equipment	Major Specifications	
1	Standard Signal Generator (SSG)	Frequency Range Modulation Output	130 to 174MHz. Frequency modulation and external modulation. 0.1μV to greater than 1mV.
2	Power Meter	Input Impedance Operation Frequency Measurement Capability	50Ω. 130 to 174MHz or more. Vicinity of 60W.
3	Deviation Meter	Frequency Range	130 to 174MHz.
4	Digital Volt Meter (DVM)	Measuring Range Accuracy	1 to 10V DC. High input impedance for minimum circuit loading.
5	Oscilloscope		DC through 30MHz.
6	High Sensitivity Frequency Counter	Frequency Range Frequency Stability	10Hz to 200MHz. 0.2ppm or less.
7	Ammeter		10A.
8	AF Volt Meter (AFVTVM)	Frequency Range Voltage Range	50Hz to 10kHz. 3mV to 3V.
9	Audio Generator (AG)	Frequency Range Output	50Hz to 5kHz or more. 0 to 1V.
10	Distortion Meter	Capability Input Level	3% or less at 1kHz. 50mV to 10Vrms.
11	Voltmeter	Measuring Range Input Impedance	1.5 to 10V DC or less. 50kΩ/V or greater.
12	4Ω Dummy Load		Approx. 4Ω, 3W.
13	Regulated Power Supply		13.6V, approx. 15A (adjustable from 9 to 17 V). Useful if ammeter equipped.

The set has been adjusted for the frequencies shown in the following table. When required, re-adjust them following the adjustment procedure to obtain the frequencies you want in actual operation.

	RX freq' fr( ) MHz			TX freq' fr( ) MHz		
	L	M	H	L	M	H
K,P,M,C2	150.050	162.050	173.950	150.000	162.000	173.995
P2,M2,C1	136.050	143.050	149.950	136.000	143.000	149.995

L : Low freq' M : Mid freq' H : Hi freq'

## ADJUSTMNET

### Common Section Adjustment

Item	Condition	Measurement			Adjustment			Specifications/Remarks	
		Test-equipment	Unit	Terminal	Unit	Parts	Method		
1. Setting	1) Write in freq' and signaling data with EEPROM writer. Source voltage : DC 13.6V POWER SW : OFF VOL VR : Full counterclockwise (CCW). TX-RX unit VR1, 5 : CCW VR2, 4 : Center								
2. PLL	RX	DVM Dummy	TX-RX Rear panel	TP2 ANT			Check	1) CH : Channel with lowest RX FREQ' (f <sub>RL</sub> ). 2) CH : Channel with highest RX FREQ' (f <sub>RH</sub> ).	1.5 ~ 3.5V <b>K,P,M,C2</b> 1.5 ~ 3.0V <b>P2,M2,C1</b>
	TX							3) CH : Channel with lowest TX FREQ' (f <sub>TL</sub> ). PTT : ON	2.5 ~ 4.0V <b>K,P,M,C2</b> 1.5 ~ 3.5V <b>P2,M2,C1</b>
		4) CH : Channel with highest TX FREQ' (f <sub>TH</sub> ). PTT : ON	6.5 ~ 9.0V <b>K,P,M,C2</b> 5.5 ~ 9.0V <b>P2,M2,C1</b>						
	3. Transmit frequency adjustment	1) CH : Channel with TX center FREQ' (f <sub>TM</sub> ). PTT : ON	f. counter Power meter	Rear panel	ANT	TX-RX	TC1	Freq' adj. of TX.	±100Hz
	2) CH : Check other channel PTT : ON						Check		

### Receiver Section Adjustment

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. BPF	1) CH : Channel with lowest RX FREQ' (f <sub>RL</sub> ). <b>K,P,M,C2</b> CH : Channel with RX center FREQ' (f <sub>RM</sub> ). <b>P2,M2,C1</b> SSG output : 0.5μV/-113dBm MOD : 1kHz DEV : ±3kHz SQ SW (↖↗) : OFF	DC V.M	TX-RX	TP1	TX-RX	L1 ~ 5	Repeat for MAX.	
2. Distortion	1) CH : Channel with RX center FREQ' (f <sub>RM</sub> ). SSG output : 501μV/-53dBm MOD : 1kHz DEV : ±3kHz	Distortion meter Oscilloscope	Rear panel	SP	TX-RX	L6	Repeat for MIN.	

## ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
3. Receiving sensitivity	1) CH : Channel with lowest RX FREQ' (f <sub>RL</sub> ), channel with RX center FREQ' (f <sub>RM</sub> ) and channel with highest RX FREQ' (f <sub>RH</sub> ). SSG output : 0.25μV/-119dBm MOD : 1kHz DEV : ±3kHz SQ SW : OFF	AF V.M Oscilloscope	Rear Panel	SP			Check	SINAD 12dB or more.
4. Squelch	1) CH : Channel with RX center FREQ' (f <sub>RM</sub> ). SQ SW : ON SSG output : 0.2μV/-121dBm 2) SSG output : 0.1μV/-127dBm 3) SSG output : 0.25μV/-119dBm	LCD			TX-RX	VR1	Set to the point at which squelch just open.	Busy indicator ( <del>ⓧ</del> ) should light.
							Check	Squelch should close. Squelch should open.
5. Adjusting decoder sensitivity for signaling squelch KQT-8	1) CH : Set the channel selector to the channel with which QT (CTCSS) is used. SSG FREQ' : Set it to the FREQ' of the channel mentioned above. SSG output : Turn the SSG output so that the SINAD sensitivity becomes 10dB. 2) SSG MOD SW : EXT. MOD AG1 FREQ' : 1kHz AG2 FREQ' : QT tone freq'. 3) AG1 : Power switch OFF. AG2 output : Adjust the output level of AG2 so that SSG deviation becomes 0.75kHz. 4) AG1 : Power switch ON. AG1 output : Adjust the output level of AG1 so that the SSG deviation becomes 3.75kHz. (i.e., QT tone frequency/ 0.75kHz deviation, +1kHz/3kHz deviation) MIC hook : ON hook MONI SW : OFF							
		Rear panel	EXT. SP	KQT-8			Check	Open.

## ADJUSTMENT

### Transmitter Section Adjustment

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. APC	1) CH : Channel with TX center FREQ' (f <sub>TM</sub> ). PTT : ON	Power meter Ammeter	Rear panel	ANT			Check	30W or more.
	2) CH : Channel with lowest TX FREQ' (f <sub>TL</sub> ) and channel with highest TX FREQ' (f <sub>TH</sub> ). PTT : ON				TX-RX	VR5	27W	±1W, 7.0A or less.
							Check	20 ~ 30W 7.0A or less.
2. Tone deviation adjustment KQT-8	1) CH : Set the channel selector to the channel with which QT (CTCSS) is used. Deviation meter filter LPF : 3kHz HPF : OFF De-emphasis : OFF PTT : ON	Power meter Deviation meter	Rear panel	ANT	KQT-8	VR1	±0.75kHz	±100Hz
3. Maximum deviation adjustment	1) Connect AG to the MIC terminal. AG : 1kHz/50mV Deviation meter filter LPF : 20kHz HPF : 50Hz De-emphasis : 750μsec. TX-RX unit VR1 : MAX CW. CH : Channel with highest TX FREQ' (f <sub>TH</sub> ). PTT : ON	Power meter Deviation meter	Rear panel	ANT	TX-RX	VR4	±4kHz ADJ. (±4.9kHz ADJ. when signaling unit installed.) Adjust one more than the other by switching between -P and +P.	±100Hz
					TX-RX	VR2	±3.0kHz ADJ. (±3.75kHz ADJ. when signaling unit installed.)	
4. MIC sensitivity adjustment	1) AG : 1kHz/5mV							
5. Protection	1) CH : Channel with lowest TX FREQ' (f <sub>TL</sub> ). ANT : OPEN PTT : ON	Ammeter					Check	7.0A or less.

### KQT-8 Parts List

Ref No.	New Parts	Parts No.	Description
<b>QT/CTCSS UNIT (X52-3100-00)</b>			
C1		CK73FB1H102K	Chip C 1000pF K
C2		C92-0010-05	Tantal 6.8μF 6.3WV
C3		C90-2082-05	Tantal 22μF 4.0WV
C4,5		CK73EB1E104K	Chip C 0.1μF K
C6		CK73EB1H223K	Chip C 0.022μF K
C7		CK73EB1E104K	Chip C 0.1μF K
C8,9		CC73FCH1H150J	Chip C 15pF J
C10		CK73FB1H102K	Chip C 1000pF K
C11		CK73FB1E473M	Chip C 0.047μF M
C12		C92-0507-05	Chip tan 4.7μF 6.3WV
C13		C92-0510-05	Chip tan 3.3μF 4.0WV
		E40-5152-05	Pin connector (10P)
X1		L77-1313-05	X'tal resonator 4.194304MHz
R1~10		RK73FB2AXXXJ	Chip R
R11		R92-0670-05	Chip R 0Ω
R12~14		RK73FB2AXXXJ	Chip R
VR1		R12-3460-05	Trimming pot. 33kΩ
Q1		DTC144TK	Digital transistor
Q2		DTA114EK	Digital transistor
Q3		2SC2712(GR)	Chip transistor
IC1		MN6520	IC
IC2		MN4094BS	IC

### KQT-8 Fine Adjustment of Tone Frequency

The tone frequency can be fine adjusted with an interval of 0.5% step over the range of 0 to +1.5%. Ground the T1 (pin 10) and T2 (pin 9) of IC1 to obtain the desired frequency.

	T1	T2
0%	X	X
+0.5%	○	X
+1.0%	X	○
+1.5%	○	○

○ : GND, X : OPEN

## KQT-8 (QT / CTCSS)

### KQT-8 Circuit Diagram

QT/CTCSS UNIT (X52-3100-00)

# SPECIFICATIONS

## GENERAL

Frequency Range .....	136 ~ 150MHz (M2,P2,C1 type) 150 ~ 174MHz (K,P,M,C2 type)
Number of Channels .....	16 semi-duplex channels
Channel Spacing .....	30kHz (PLL channel step 5.0kHz)
Input Voltage .....	13.6V DC negative ground
Current Drain .....	0.3A on standby 0.7A on receive 6.0A on transmit
Duty Cycle .....	Receiver 100%, Transmitter 20%
Temperature Range .....	-30°C to +60°C (-22°F to +140°F)
Dimensions and Weight .....	5.51" (140mm) W x 1.58" (40mm) H x 34" (161mm) D, 2.20lbs. (1.0kg)

## RECEIVER

(Measurements made per EIA standard EIA-204-C)

RF Input Impedance .....	50Ω
Sensitivity	
EIA 12dB SINAD .....	0.2μV
20dB Quieting .....	0.3μV
Squelch Sensitivity .....	0.25μV threshold
Modulation Acceptance .....	±7kHz
Selectivity .....	-80dB
Intermodulation .....	-75dB
Spurious and Image Rejection .....	-90dB
Audio Power Output .....	4W at 4Ω less than 5% distortion
Frequency Stability .....	±0.0005% from -30°C to +60°C
Channel Frequency Spread .....	24MHz

## TRANSMITTER

(Measurements made per EIA standard EIA-152-B)

RF Power Output .....	25W adjustable to 5W
RF Output Impedance .....	50Ω
Spurious and Harmonics .....	-70dB
Modulation .....	F3E, ±5kHz for 100% at 1000Hz
FM Noise .....	-50dB
Microphone Impedance .....	Low impedance
Audio Distortion .....	1.0% at 1000Hz
Frequency Stability .....	±0.0005% from -30°C to +60°C
Channel Frequency Spread .....	24MHz

## KENWOOD CORPORATION

Shionogi Shibuya Building, 17-5, 2-chome Shibuya, Shibuya-ku, Tokyo 150, Japan

### KENWOOD U.S.A. CORPORATION
